

In this project, I wanted to focus on making something functional. The spoon holder stemmed out of a problem I often encounter with how to put down spoons in bowls. Most of the bowls in my kitchen are plastic and will tip over if you leave a spoon sitting in them, so out of habit, I began to leave spoons on the table, which would make a mess. The spoon holder alleviates that.

I think my print came out relatively well. The base layers of the plastic didn't stick to the glass as well as I liked, so the ends bend up a little and the pieces are not as flush as they could be.

The piece is functional with the one bowl it was designed with. To improve it, it could be made more modular. A coating of caulking or some kind of malleable rubber on the inside of the clip would allow it to fit to more bowls. Also adding an adjustable screw-like structure to the clip would make it adjustable and useable on more bowls. I chose to design it for a particular bowl since I thought it would be more successful for a singular bowl, rather than have it be kind-of successful for every bowl.
